

How to Run PAMS

Ahmed Saad (24062019) | Omar Hassanin (24062048) | Group 33

What you need

You need Python 3.10 or higher. Download it from python.org if you dont have it. You also need to install PyQt6 which is explained below. Thats it, nothing else is needed.

Step 1 - Extract the zip file

Extract the zip file you were given. Open the pams folder inside it. You should see main.py in there.

Step 2 - Open a terminal in the pams folder

On Windows, go into the pams folder, click the address bar at the top, type cmd and press enter. Or open PowerShell and navigate to it:

```
cd C:\Users\YourName\Downloads\pams
```

Step 3 - Install PyQt6

Run this command once:

```
pip install PyQt6
```

Step 4 - Run the app

Just run this:

```
python main.py
```

The login window will open. The database is created automatically the first time you run it.

Login details

Role	Email	Password
Admin	admin1@pams.com	admin123
Front desk	frontdesk1@pams.com	desk123
Finance	finance1@pams.com	finance123
Maintenance	maintenance1@pams.com	maintenance123

Manager	manager1@pams.com	manager123
Admin London	admin2@pams.com	admin123
Front desk Cardiff	frontdesk2@pams.com	desk123

How to run the tests

Run this command from inside the pams folder:

```
python -m pytest tests/test_pams.py -v
```

If pytest is not installed first run:

```
pip install pytest
```

All 52 tests should pass.

Reset the database

If you want to start fresh, delete the database file and run the app again:

```
del database\pams.db  
python main.py
```

If something goes wrong

- App doesnt start - make sure you are inside the pams folder where main.py is
- Module not found - run pip install PyQt6 again
- Database error - delete database\pams.db and run again
